

The yfinance Python library

The yfinance is a Python library that provides a user-friendly interface for downloading historical market data from Yahoo Finance. It allows you to get historical stock prices, dividends, and other financial data for stocks, Exchange-Traded Funds (ETFs), and other securities.

This example shows code on how to use yfinance to download historical stock prices:

```
1. 1
2. 2
3. 3
4. 4
5. 5
6. 6
7. 7
8. 8

1. import yfinance as yf
2.
3. # Download historical data for a stock
4. msft = yf.Ticker("MSFT")
5. msft_data = msft.history(period="max")
6.
7. # Display the downloaded data
8. msft_data.head()
```

Copied!

In the above code:

- First, import the yfinance library using the alias yf.
- Then, create a Ticker object for the Microsoft stock ("MSFT").
- Use the history method of the Ticker object to download the historical data for the stock. The period parameter of the history method specifies the time period for which we want to download the data. In this example, set it to max to download the maximum amount of available historical data.

Here are some of the possible values for the period parameter and what they represent:

- period="1d": Download 1 day of historical data.
- period="5d": Download 5 days of historical data.
- period="1mo": Download 1 month of historical data.
- period="3mo": Download 3 months of historical data.
- period="6mo": Download 6 months of historical data.
- period="1y": Download 1 year of historical data.
- period="2y": Download 2 years of historical data.
- period="5y": Download 5 years of historical data.
- period="10y": Download 10 years of historical data.
- period="ytd": Download historical data since the beginning of the current year.
- period="max": Download all available historical data.

Finally, we print the downloaded data using the head function. This will display a Pandas DataFrame containing the historical stock prices and other financial data for Microsoft.
